

Method Comparison — GradCAM++ vs LIME (proposed model)

GradCAM++ gives tight focal hot-spots aligned to the lesion; LIME super-pixel boundaries are noisy and over-broad.

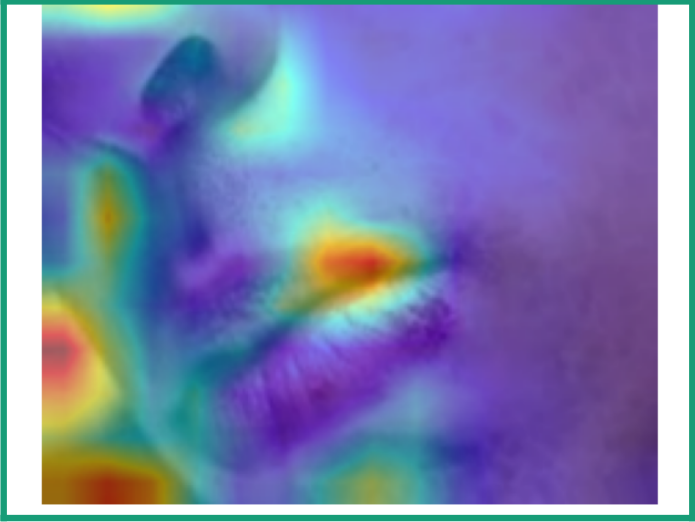

CoS - lip vesicle

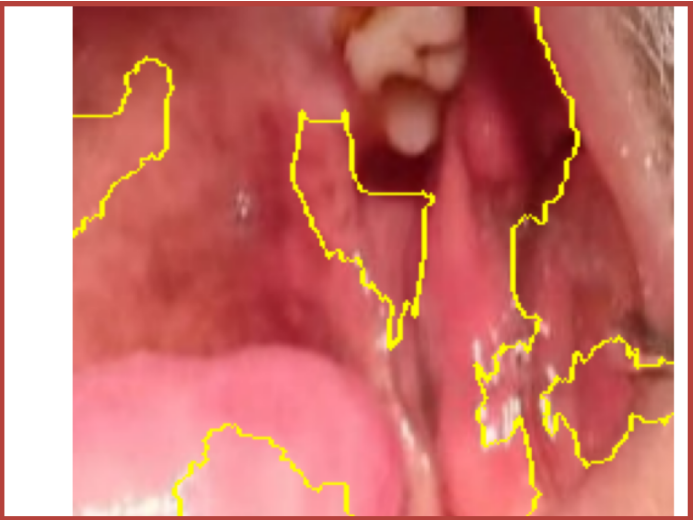

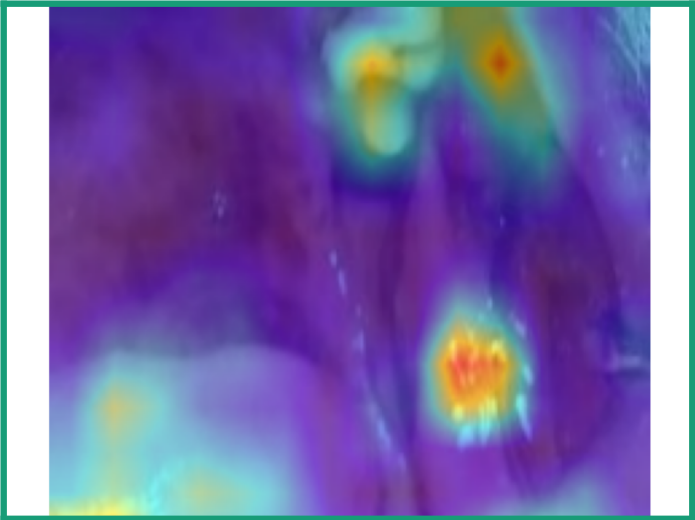

OLP - bilateral patches

Gum - inflamed lip margin

Malignant - ulcerated region

Verdict: GradCAM++ is the selected explainability method - tight focal localisation on lesions across all 18 inspected tiles, vs noisy / over-broad super-pixel boundaries from LIME.
